Figure 5: Figure 5. Bicoherence plot illustrating nonlinear interactions between cyclic components of the Growth Index record. The WOSA power spectra are shown along the horizontal and vertical axes, with major cyclic components indicated by gray lines. The color scale represents the bicoherence magnitude (ranging from 0 to 1) corresponding to the strength of nonlinear coupling between frequencies. Regions significant at the 95% confidence level are outlined by thick black contours, while inferred nonlinear interactions are highlighted with black dotted lines.
